

IN THE CLAIMS

1. (Currently amended) A method comprising:
receiving a polling request that specifies a first temporal period and a first temporal offset for a plurality of expected future transmissions from a first station; and
establishing a polling schedule based on said polling request;
receiving a plurality of frames for forwarding to said first station;
determining whether the arrival times of said frames are substantially periodic as described by a second temporal period and a second temporal offset;
and
establishing, when the arrival times of said frames are substantially periodic, a transmission schedule for transmitting each of said frames to said first station;
wherein said transmission schedule is based on said second temporal period and said second temporal offset; and
transmitting each of said frames to said first station in accordance with said transmission schedule, wherein said transmitting and said receiving said plurality of frames are via a shared-communications channel.
2. Canceled
3. (Original) The method of claim 1 further comprising transmitting a poll to said first station in accordance with said polling schedule, wherein the transmission of said poll and the reception of said polling request are via a shared-communications channel.
4. (Previously Presented) The method of claim 3 wherein the transmission of said poll and the reception of said polling request are in accordance with a wireless local area network protocol.

5. Cancel

6. Cancel

7. (Currently amended) The method of claim 5-1 wherein said transmission schedule is also based on said polling schedule.

8. (Currently amended) The method of claim 5-1 further comprising combining said polling schedule and said transmission schedule into a composite schedule.

9. Cancel

10. (Currently Amended) A method comprising:
transmitting a polling request that specifies a temporal period and a temporal offset for a plurality of expected future transmissions;
queuing a frame in accordance with said temporal period and on said temporal offset;
receiving a poll; ~~and~~
transmitting said frame in response to said poll; and
receiving a plurality of frames from a station in accordance with a transmission schedule established at said station, said transmission schedule based on a second temporal period and a second temporal offset as determined in accordance with arrival times of said plurality of frames at said station;

11. Canceled

12. (Original) The method of claim 10 wherein the transmission of said polling request, the transmission of said frame, and the reception of said poll are via a shared-communications channel.

13. (Previously Presented) The method of claim 12 wherein the transmission of said polling request, the transmission of said frame, and the reception of said poll are in accordance with a wireless local area network protocol.

14. (Currently amended) An apparatus comprising:

a receiver for receiving a polling request that specifies a first temporal period and a first temporal offset for a plurality of expected future transmissions from a first station; and

a processor for establishing a polling schedule based on said polling request;

wherein said receiver is also for receiving a plurality of frames for forwarding to said first station; and

wherein said processor is also for:

(i) determining whether the arrival times of said frames are substantially periodic as described by a second temporal period and a second temporal offset;

(ii) establishing, when the arrival times of said frames are substantially periodic, a transmission schedule for transmitting each of said frames to said first station, wherein said transmission schedule is based on said second temporal offset and said second temporal period; and

wherein said processor is also for combining said polling schedule and said transmission schedule into a composite schedule.

15. (Original) The apparatus of claim 14 further comprising a transmitter for transmitting a poll to said first station in accordance with said polling schedule.

16. (Previously Presented) The apparatus of claim 15 wherein said transmitter and said receiver operate in accordance with a wireless local area network protocol.

17. Cancel

18. Cancel

19. (Currently amended) The apparatus of claim ~~47~~ 14 further comprising a transmitter for transmitting:

- i. said poll to said first station in accordance with said polling schedule; and
- ii. each of said frames to said first station in accordance with said transmission schedule.

20. (Previously Presented) The apparatus of claim 19 wherein said transmitter and said receiver operate in accordance with a wireless local area network protocol.

21. (Currently amended) An apparatus comprising:
a transmitter for transmitting a polling request that specifies a temporal period and a temporal offset for a plurality of expected future transmissions;
a receiver for receiving a poll in response to said polling request; and
a processor for queuing a frame in accordance with said temporal period and on said temporal offset;

wherein said receiver is also for receiving a plurality of frames for forwarding to said first station; and

wherein said processor is also for:

(i) determining whether the arrival times of said frames are substantially periodic as described by a second temporal period and a second temporal offset;

(ii) establishing, when the arrival times of said frames are substantially periodic, a transmission schedule for transmitting each of said frames to said first station, wherein said transmission schedule is based on said second temporal offset and said second temporal period; and

wherein said processor is also for combining said polling schedule and said transmission schedule into a composite schedule.

7

22. (Previously Presented) The apparatus of claim 21 wherein said transmitter is also for transmitting said frame in response to said poll, and wherein said transmitter and said receiver operate in accordance with a wireless local area network protocol.

23. (New) The apparatus of claim 21 wherein the transmitting of said polling request, the transmitting of said frame, and the reception of said poll are via a shared-communications channel.
